

February 5th, 2008

Today I scripted a easy and simple AJAX Pagination application using PHP/MYSQL. It basically will render a php page using ajax. This just so happens that the php page goes out to a database and grabs 50 rows. This will enhance the interface for DL Monitor.. you can find the file here.

This is just for testing and learning. Im not sure whether or not this will be included in the next version of DL Monitor. AJAX was iniitially slated to be included in version 3. This is really just for anyone looking to learn ajax, php, or mysql. Its pretty easy once you get into it, but then again I basically pulled this content from what already existed in DL Monitor.

Anyway, i hope someone else can use it.

Besides that we've just been hacking away at the next project. It is by far our biggest yet and spans 2 years worth of prototypes and developing ideas. Here's hoping...
