

November, 25th 2008

What a weekend. Last friday our network went down. Everything seemed to be working fine but the traffic wasn't getting out to the internet. The router appeared to be working fine, as far as getting external ip's, assigning internal ips, recognizing static ips, etc. But for some reason it wouldnt allow traffic in or out.

To add to that our disk array lost some partitions that appear to be fine. Not all the partitions on the same disk went out so we have a half operational disk. Anyway...

We were able to put in an old router in place for the time being. However it doesnt support loopback traffic since its a cheapo. This is the error you'll see everywhere saying "401 The web site is blocked by administrator." We were able to fix this error on our checkndo.com but on dlmonitor.com there are too many places that reference other locations of our server and we cant change them to not display these messages.

We have 2 new routers on the way, and they should be up and running in a couple of days. As for the disks, well, we are working on them and are hoping within the next day or 2 we can have that all squared away.
