

April 24th, 2008

First of all I'm not sure why I typed October for the last couple of posts, they were in Feb. of 2008. Now, sorry it's been a long time. We've been busy with other projects, life, and trying to come up with a profitable business. This clearly is not it. Not that we won't continue our work here. But we just aren't making any money on ads and not 1 single person has ever donated. So we are trying to look for a project that we can make some money and further fund these products. None of the projects are dead; we still have plenty of ideas for everything and are well aware of many of the issues they face. To add to that Visual studio 2008 is out and we've really started to buckle down and learn more about what it can offer, meaning that many of our interfaces will hopefully improve over time. Also, our coding continues to evolve as we gain experience and write reusable code. The problem is now to update all the programs to use the newest version of what we've written. One instance is to incorporate our other product DL Monitor into everything more. And because there were some other issues, the first one we decided to update was Complete Calc. Available immediately. It doesn't contain many changes; the big ones are listed in the change log. But there were several minor code updates on the back end. These updates sliced the file size to nearly 1/4 of its last size as far as disk space is concerned. Well, that's all I have for now. I'm not promising anything else will get an update soon, but it's not out of the realm of possibilities.
