

General History

Complete Calc is a small program that can be used to calculate long mathematical problems. Typically when you use a calculator you enter several values in, right? Well, what happens when you forget what you last entered? That's right, you start all over again, wasting a lot of your valuable time. It has a familiar interface and size, in fact it looks almost identical to the one that comes with windows. It's free, keeps a record of what you enter in, and does order of operations with no problem. How would you like not having to think about how to enter the problem in and what you entered in so far, stop worrying, instead use Complete Calc and forget about it. Complete Calc is a program that we've been writing since early November of 2006. It was started to fill our needs for a better calculator. It was the second program that we publicly distributed (on January 10th, 2007).
