

## Pictures

This is the main form where you can select what operation you would like to do: shutdown, restart, or log off. Once you choose that you can select in or on. If you select in select it to shut down in x amount of days:hours:min. If you select on you can choose a specific date and time if you don't want to figure out how many days hours and min tomorrow at 7:00pm is. once that's selected click the set button and it will show you when it is schedule for at the bottom. You cannot directly edit this box. To make a new time simple choose a new time and click set again, this will overwrite your previous scheduled time. The stop watch is very simple to use. Just click start to activate the reset button and change the start button into the stop button. Now you can reset or stop the timer. When stopped it'll display the start, stop, and elapsed time. This is the about menu, it is standard with all our other programs. You can check for updates or go to our website from here. [Click to enlarge](#)

Note: The program must be running in order for the computer to shut down. If it is minimized it is still running and will shut down when scheduled to. To cancel Before your shutdown time simply exit the program. If it has already started counting down (immediately before it shuts down) the only way to abort is to click File->Abort. If you cannot see the file menu you may have to drag the window.
